

## **ARRISA**

### **At Risk Registers Integrated into Primary Care to Stop Asthma crises in the UK**

This study aims to test the hypothesis that by identifying patients with asthma who are deemed at risk of severe exacerbations and flagging their primary care Electronic Health Record, training medical, nursing and administrative staff about the systematic management of these patients, and providing on-going practice support will reduce crisis asthma events.

There is no patient recruitment to this study but practices will be randomised to intervention or control group. For those randomised to the intervention group will undergo online training.
